REC'D 22 NOV 1999

WIPO PCT

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- If you need help to fill in this form or you have any questions, please contact the Patent Office on 01645 500505.
- Write your answers in capital letters using black ink or you may type them.
- If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- Once you have filled in the form you must remember to sign and date it.
- For details of the fee and ways to pay please contact the Patent Office.

METHODS OF TREATMENT

The present invention relates to methods of treatment, in particular it relates to methods of treating weight loss due to underlying disease
5 (cachexia).

Weight loss due to underlying disease, often termed "cachexia", occurs in patients with a wide variety of diseases including acquired immune deficiency syndrome (AIDS), liver cirrhosis, chronic obstructive
10 pulmonary disease, chronic renal failure, chronic infections including pneumonia, cancer (cancer cachexia), diabetes and heart disease including hypertension and chronic heart failure (CHF) (cardiac cachexia). Cachexia may also occur idiopathically.

15 In all cases, cachexia may be an indicator of a poor prognosis and its reversal, stopping or at least slowing down, is desirable. Indeed, a strong relationship between weight loss and mortality has been found for many conditions.

20 Hormonal changes and catabolic/anabolic imbalance in chronic heart failure (CHF) and their relevance in cardiac cachexia has been discussed in Anker *et al* (1997) *Circulation* **96**, 526-534. Similarly, catecholamine levels, serum uric acid levels, TNF α levels and other hormone levels have been measured in patients with CHF (see, for example, Anker *et al* (1997)
25 *Heart* **78**, 39-43; Anker *et al* (1998) *Q J. Med.* **91**, 199-203; Anker (1998) *Eur. Heart J.* **19**, (Suppl F), F56-F61; Anker *et al* (1997) *J. Amer. Coll. Cardiol.* **30**, 997-1001; Anker *et al* (1999) *Eur. Heart J.* **20**, 683-693; Anker (1999) *Chest* **115**, 836-847). In addition, studies have been made

of the loss of bone mineral in patients with cachexia due to CHF (Anker *et al* (1999) *Am. J. Cardiol.* 83, 612-615).

However, no-one has suggested that reducing sympathetic nervous system activity and/or improving cardiovascular reflex status would be beneficial to patients with cardiac cachexia and also to patients with cachexia due to any cause and, indeed, idiopathic cachexia.

A first aspect of the invention provides a method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of an agent which reduces sympathetic nervous system activity and/or improves cardiovascular reflex status.

Without prejudice to further aspects of the invention and without being bound by any theories as to how the invention works, we believe that the information described in the Examples indicates that agents which inhibit sympathetic nervous system activity, either directly or indirectly, (for example by directly or indirectly having ergo-reflex, chemoreflex or baroreflex effects) have a beneficial effect on cachexia probably by a reduction of apoptosis, a reduction in metabolic rates or by vasodilation with better blood flow to tissues. We provide information that, surprisingly, certain pathways are abnormal in cachexia due to a wide range of underlying diseases, but they are not abnormal in weight loss due to starvation.

25

A second aspect of the invention provides a method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of any one or more of the following: a

compound which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α receptor antagonist; a ganglion blocking agent; a drug that has an effect on cardiovascular reflexes and thereby
5 reduce SNS activity such as an opiate *via* chemoreceptor; scopolamine; an endothelin receptor antagonist; a xanthine oxidase inhibitor; and erythropoietin.

- 10 The method may be used on any mammal and so the term "patient" includes a human patient and also includes any other mammal including domestic animals such as cats and dogs, and farm animals such as cows, pigs, horses, sheep, goats and the like. It is preferred if the method is used to treat humans.

- 15 A third aspect of the invention provides a method of treating weight loss due to underlying disease in a patient the method comprising electrically stimulating the patient's muscles. This may be done using any transcutaneous electrical stimulator applied to the skin over a muscle or its
20 nerve to stimulate muscle contractions. Suitably, to increase muscle strength and bulk high frequency stimulation (eg 50 Hz) is used. In contrast low frequency stimulation (eg 10 Hz) may enhance slow fatigue resistant fibres and could cause a fibre type shift which could reduce strength and so is not preferred.

- 25 In treating weight loss due to underlying disease in a patient it is useful if the weight loss is reversed or stopped or at least slowed down.

The aforementioned compounds and procedures are useful for the treatment or prevention of weight loss due to underlying disease (cachexia). These underlying diseases include, for example, but are not restricted to, AIDS, liver cirrhosis, chronic obstructive pulmonary disease with or without emphysema, chronic renal failure, chronic infections (like pneumonia), cancer (ie cancer cachexia), and heart disease including hypertension and chronic heart failure (ie cardiac cachexia), and idiopathic cachexia (ie cachexia due to unknown disease).

Compounds or procedures that may reduce angiotensin II plasma levels and therefore are useful in the practice of the invention include:

1. any compound with an inhibiting effect on aldosterone, eg aldosterone antagonists such as spironolactone (which may be given at between 12.5 mg and 300 mg per day, orally) and testolactone (which may be given at 40 mg/kg per day, orally), RU40555 (which may be given at 10-30 mg/kg orally), RU26752 (a synthetic aldosterone antagonist), canrenoate (which may be given at 20 mg/day iv) also known as Canrenoate Potassium, eplerenone (oral), 3-(17 beta-hydroxy-3-oxoandrosta-1,4,6,11-tetraen-17 alpha-yl)propionic acid gamma-lactone, 3-(9 alpha-fluoro-17 beta-hydroxy-3-oxoandrost-4-en-17 alpha-yl)propionic acid gamma-lactone (31), dihydrospirorenone, spirorenone, 15,16-methylene derivatives of spironolactone, mespirenone (CAS 87952-98-5) and SC9420;
2. chymase inhibitors, including alendronate, aprotinin and tissue inhibitors of matrix metalloproteinases (TIMPs);

3. cathepsin B inhibitors, including epoxysuccinyl peptides such as CA-074 and E-64c, stefinA, cystatin C (endogenous inhibitor), CA074 (a specific inhibitor of cathepsin B) and E-64 (natural inhibitor of cathepsin B);
- 5 4. exercise training;
5. electrical muscle stimulation;

Compounds that may reduce catecholamine plasma levels and the activity of the sympathetic nervous system (SNS) include:

10

6. Beta (β) receptor blockers including acebutolol, alprenolol, atenolol, betaxolol, bisoprolol, carteolol, celiprolol, esmolol, labetolol, lavobunolol, metipranolol, metoprolol, nadolol, oxprenolol, penbutolol, pindolol, propranolol, sotalol, nebivolol, carvedilol, bucindolol and timolol; Atenolol and bisoprolol are preferred.
- 15 7. imidazoline receptor antagonists (including moxonidine, clonidine, rilmenidine, pentamidine (1,5-bis (4-amidonophenoxy)pentane) and alpha methyl dopa;
- 20 8. centrally acting alpha receptor agonists like clonidine;
9. peripherally acting alpha receptor antagonists such as doxazosin (which may be given at 1-16 mg orally per day), prazosin, terazosin and ipsapirone;
10. ganglion blocking agents including azamethonium, dicolinium, hexamethonium, mecamlamine, pentamethonium, pentolinium, trimetaphan, benzo hexonium, hexafluorenium, cypenam, trimethaphan canfosulfonate, tetraethylammonium bromide, and
- 25

synapleg;

11. drugs that have effects on cardiovascular reflexes and thereby reduce SNS activity including
 - opiates (*via* chemoreceptor) such as dihydrocodeine, morphine, diamorphine and buprenorphine
 - scopolamine;
12. xanthine oxidase inhibitors including allopurinol (which may be given at 50-1000 mg per day orally), 7,8-dihydroneopterin, 5,6,7,8-tetrahydrobiopterin, leukopterin, xanthopterin, neopterin, biopterin, 4-amino-6-hydroxypyrazolo[3,4-d]pyrimidine (AHPP), and oxypurinol;

Allopurinol is preferred.

- 15 Endothelin receptor (such as ET-I receptor) antagonists include
 - endothelin receptor A antagonist BQ 123
 - ETB-receptor antagonist BQ-788
 - A-216546 ([2S-(2,2-dimethylpentyl)-4S-(7-methoxy-1,3-benzodioxol-5-yl)-1-(N,N-di(n-butyl) aminocarbonylmethyl)-pyrrolidine-3R-carboxylic acid), a potent antagonist with > 25,000-fold selectivity for the endothelin ET(A) receptor
 - ABT-627 (1, A-147627, active enantiomer of A-127722), a 2,4-diaryl substituted pyrrolidine-3-carboxylic acid based endothelin receptor-A antagonist. This compound binds to the ETA receptor with an affinity (K_i) of 0.034 nM and with a 2000-fold selectivity for the ETA receptor versus the ETB receptor.
 - IRL 3461: a potent endothelin antagonist with balanced ETA/ETB

affinity

- oral endothelin-receptor antagonist bosentan (0.1 – 1.0 g BID, preferred 0.25 – 0.5 g BID), has combined ETA/ETB affinity
- LU135252, a selective antagonist of the ETA receptor
- 5 - S-0139, (+)-disodium 27-[(E)-3-[2-[(E)-3-carboxylatoacryloylamino]-5-hydroxyphenyl]acryloyloxy]-3-oxoolean-12-en-28-oate, an ETA selective antagonist
- N-(6-(2-(5-bromopyrimidin-4-yl)-4-(2-hydroxy-1, 1-dimethylethyl)-benzensulfonamide sodium salt sesquihydrate (T-0201), a
- 10 nonpeptide endothelin (ET) receptor antagonist. In binding studies, T-0201 competitively antagonized the specific binding of [125I]-ET-1 to human cloned ETA receptors
- unselective ET(A)/ET(B) receptor antagonist, PD 142,893
- PD164333, an analogue of the orally active butenolide antagonists
- 15 of the endothelin ETA receptor
- Ro 61-1790 [5-methyl-pyridine-2-sulfonic acid 6-(2-hydroxyethoxy)-5-(2-methoxy-phenoxy)-2-(2-1H-tetrazol-5-yl- + + +pyridin-4-yl)-pyrimidin-4-ylamide] is a competitive ET antagonist with an affinity to ETA receptor in the subnanomolar
- 20 range. It has an approximately 1000-fold selectivity for the ETA vs the ETB receptor
- ET-A antagonist PD-156,707
- SB 209670, a rationally designed potent nonpeptide endothelin receptor antagonist
- 25 - endothelin B receptor-selective antagonist: IRL 1038, [Cys11-Cys15]-endothelin-1(11-21)
- WS-7338 B, a specific antagonist for vascular ETA receptors.

The endothelins (ETs) are a family of bicyclic 21-amino acid peptides that are potent and prolonged vasoconstrictors. ET receptor antagonists improve peripheral blood flow, improve muscle metabolic status and thereby ergoreflex, and, we believe, thereby reduce SNS activity. ET-A receptor blockade is preferred in the practice of the invention.

The various compounds are described in at least the following publications:

10

RU40555

Evaluation of RU28318 and RU40555 as selective mineralocorticoid receptor and glucocorticoid receptor antagonists, respectively: receptor measures and functional studies. Kim PJ, Cole MA, Kalman BA, Spencer RL. *J Steroid Biochem Mol Biol* 1998 Nov 67:3 213-22.

20 Erythropoietin may be any suitable form of erythropoietin. Typically, when the patient to be treated is a human, the erythropoietin is recombinant human erythropoietin (rhEPO).

Without prejudice to any aspect of the invention, and without being bound 25 by any theory concerning the way the invention works, we believe that EPO improves oxygen delivery to muscle which leads to a better muscle metabolic state which decrease ergoreflex and improves cachexia.

Without prejudice to any aspect of the invention and without being bound by any theory concerning the way the invention works, we believe that administration of opiate agents will suppress firing of the arterial chemoreflexes and *via* this action will inhibit sympathetic nervous system activity and *via* this action will delay the progression of cachexia.

Without prejudice to any aspect of the invention, and without being bound by any theory concerning the way the invention works, we believe that scopolamine enhances baroreflex activity and by specific enhancement of vagal activity will *via* this action inhibit sympathetic nervous system activity and *via* this action will delay the progression of cachexia.

Without prejudice to any aspect of the invention, and without being bound by any theory concerning the way the invention works, we believe that aldosterone antagonists may prevent or reduce myocardial and skeletal muscle fibrosis which enables muscle to act more efficiently and thereby prevent or reduce the stimulus for SNS reflex abnormalities.

The above-mentioned classes of compounds and procedures are also useful in the treatment or prevention of weight loss due to the ageing process. They, as well as others mentioned below, are also useful in the enhancement of exercise performance in health.

Thus, a fourth aspect of the invention provides a method of treating or preventing weight loss due to the ageing process in a patient the method comprising administering to the patient an effective amount of an agent which reduces sympathetic nervous system activity.

A fifth aspect of the invention provides a method of treating or preventing weight loss due to the ageing process in a patient the method comprising administering to the patient an effective amount of any one or more of a compound which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α receptor antagonist; a ganglion blocking agent; a drug that has an effect on cardiovascular reflexes and thereby reduce SNS activity such as an opiate *via* chemoreceptor, a digitalis alkaloid *via* enhancement of baroreflex sensitivity; scopolamine; an ET-1 receptor antagonist; an xanthine oxidase inhibitor; and erythropoietin.

Without prejudice to any aspect of the invention, and without being bound by any theory concerning the way the invention works, we believe that digitalis alkaloids will, *via* increasing sensitivity of the arterial baroreflexes, inhibit sympathetic nervous system activity and, by this action, delay the weight loss.

A sixth aspect of the invention provides a method of treating or preventing weight loss due to the ageing process in a patient the method comprising electrically stimulating the patient's muscles. Typically, the patient to be treated is >65 years old. An overview about human weight homeostasis and weight loss due to ageing is given in Anker *et al* (1999) *Chest* 115, 836-847.

25

A seventh aspect of the invention provides a method of enhancing exercise performance in a healthy individual the method comprising administering to the individual an effective amount of any one or more of a compound

which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α receptor antagonist; a ganglion blocking agent; a
 5 drug that has an effect on cardiovascular reflexes and thereby reduce SNS activity such as an opiate *via* chemoreceptor, a digitalis alkaloid *via* enhancement of baroreflex sensitivity, scopolamine, or an anabolic growth factor like growth hormone and insulin-like growth factor-I (IGF-I) *via* effects on metabo-ergoreceptor; an ET-1 receptor antagonist; a TNF α
 10 antagonist; an xanthine oxidase inhibitor; and erythropoietin, and an eighth aspect of the invention provides a method of enhancing exercise performance in a healthy patient the method comprising electrically stimulating the patient's muscles.

15 Similarly, without prejudice and without being bound by any theory, we believe that anabolic growth factors and insulin growth factor-1 may increase skeletal muscle bulk and reduce the metabolic stress in a given muscle on exercise which will produce less stimulation of the work-sensitive muscle ergoreceptors (metaboreceptors) and will *via* this action
 20 inhibit sympathetic nervous system activity and *via* this action will delay the progression of cachexia.

Suitable digitalis alkaloids include digoxin and digitoxin and are believed to work in the context of the invention *via* enhancement of baroreflex
 25 sensitivity.

Suitable anabolic growth factors include growth hormone and insulin-like growth factor-I, and are believed to act *via* effects on the metabo-

ergoreceptor.

By "TNF α antagonists" we mean any agent which blocks the activity of TNF α . Such antagonists include anti-TNF α antibodies and suitable forms
5 of TNF α receptor (eg soluble forms) that bind to TNF α and render TNF α molecules to be biologically less active.

Furthermore, the classes of compounds described in numbered groups 1, and 6 to 10 are also useful in preventing weight loss consequent to
10 cardiovascular disorders in patients at risk of heart disease including hypertension, dyslipidaemia and diabetes.

Thus, a ninth aspect of the invention provides a method of preventing weight loss consequent to a cardiovascular disorder in a patient at risk of
15 heart disease the method comprising administering to the patient an effective amount of any one or more of a compound with an inhibiting effect on aldosterone; a β -receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor agonist, a peripherally acting α receptor antagonist; and a ganglion blocking agent.

20

The drugs are administered to the patient in any suitable form or by any suitable route in order to have the desired effect. The invention also includes the use of the drug in the manufacture of a medicament for treating the patient as said.

25

The aforementioned compounds for use in the methods of the invention or a formulation thereof may be administered by any conventional method including oral and parenteral (eg subcutaneous or intramuscular or

intravenous) injection and inhaled and per-rectal and buccal. The treatment may consist of a single dose or a plurality of doses over a period of time.

5 Whilst it is possible for a compound for use in the methods of the invention to be administered alone, it is preferable to present it as a pharmaceutical formulation, together with one or more acceptable carriers. The carrier(s) must be "acceptable" in the sense of being compatible with the compound of the invention and not deleterious to the recipients thereof. Typically, the carriers will be water or saline which will be sterile and pyrogen free.

10

As noted above, the compounds for use in the methods of the invention may be formulated for use. The formulations may conveniently be presented in unit dosage form and may be prepared by any of the methods well known in the art of pharmacy. Such methods include the step of bringing into
15 association the active ingredient (compound of the invention) with the carrier which constitutes one or more accessory ingredients. In general the formulations are prepared by uniformly and intimately bringing into association the active ingredient with liquid carriers or finely divided solid carriers or both, and then, if necessary, shaping the product.

20

Formulations in accordance with the present invention suitable for oral administration may be presented as discrete units such as capsules, cachets or tablets, each containing a predetermined amount of the active ingredient; as a powder or granules; as a solution or a suspension in an aqueous liquid
25 or a non-aqueous liquid; or as an oil-in-water liquid emulsion or a water-in-oil liquid emulsion. The active ingredient may also be presented as a bolus, electuary or paste.

A tablet may be made by compression or moulding, optionally with one or more accessory ingredients. Compressed tablets may be prepared by compressing in a suitable machine the active ingredient in a free-flowing form such as a powder or granules, optionally mixed with a binder (eg povidone, gelatin, hydroxypropylmethyl cellulose), lubricant, inert diluent, preservative, disintegrant (eg sodium starch glycolate, cross-linked povidone, cross-linked sodium carboxymethyl cellulose), surface-active or dispersing agent. Moulded tablets may be made by moulding in a suitable machine a mixture of the powdered compound moistened with an inert liquid diluent. The tablets may optionally be coated or scored and may be formulated so as to provide slow or controlled release of the active ingredient therein using, for example, hydroxypropylmethylcellulose in varying proportions to provide desired release profile.

Formulations suitable for parenteral including intravenous administration include aqueous and non-aqueous sterile injection solutions which may contain anti-oxidants, buffers, bacteriostats and solutes which render the formulation isotonic with the blood of the intended recipient; and aqueous and non-aqueous sterile suspensions which may include suspending agents and thickening agents. The formulations may be presented in unit-dose or multi-dose containers, for example sealed ampoules and vials, and may be stored in a freeze-dried (lyophilised) condition requiring only the addition of the sterile liquid carrier, for example water for injections, immediately prior to use. Extemporaneous injection solutions and suspensions may be prepared from sterile powders, granules and tablets of the kind previously described.

Preferred unit dosage formulations are those containing a daily dose or unit, daily sub-dose or an appropriate fraction thereof, of an active ingredient.

5 It should be understood that in addition to the ingredients particularly mentioned above the formulations of this invention may include other agents conventional in the art having regard to the type of formulation in question, for example those suitable for oral administration may include flavouring agents.

10 Typically, the drug is administered when cachexia is diagnosed (duration of treatment: for the lifetime of the patient) or if a patient is thought to be at risk of developing cachexia. The drug is administered at a frequency and in sufficient amount to maintain trough levels of the agent at about 50% of peak dosing levels.

15

Other drugs which may be suitable in the practice of the invention as discussed above are known in the art; some of these compounds are listed for example in the latest editions of the British National Formulary and in the latest edition of Martindale's Pharmacopoeia.

20

The invention will now be described in more detail with reference to the following Examples and Figures wherein

Figure 1 shows individual data for noradrenaline plasma levels which is
25 summarised in Figure 2.

Figure 2 shows that chronic wasting disorders show increased activity of SNS (sympathetic nervous system) as evidenced by increased plasma

noradrenaline levels. All of the cachectic disorders marked (*) have mean plasma noradrenaline levels which are higher than normal.

Figure 3 shows that, on average, patients with active wasting disease have
 5 2.5 to 13-fold increased aldosterone levels compared to healthy controls (their mean : 43.2 ng/ml, upper limit or normal : 81 ng/ml). Patients with weight loss due to malnutrition have normal aldosterone levels.

Example 1: Catecholamines in chronic heart failure patients

10 *Noradrenaline plasma levels in chronic heart failure patients*

Chronic heart failure (CHF) is a complex disorder affecting an increasing number of patients in the community with a prevalence of 10 to 30% in people over the age of 65 years [Cowie MR, Mostered AA, Wood DA,
 15 Deckers JW, Poole-Wilson PA, Sutton GC, Grobbee DE. The epidemiology of heart failure. *Europ Heart J* 1997; 18:208-225.]. Multiple physiological pathways are pathologically affected, and a series of vicious cycles have been suggested that could transform cardiac abnormalities into haemodynamic, endocrine, immunological, and
 20 muscular abnormalities that all contribute to the clinical picture of chronic heart failure [Packer M. The neurohormonal hypothesis: A theory to explain the mechanism of disease progression in heart failure. *J Am Coll Cardiol* 1992;20:248-254; Anker SD, Clark AL, Kemp M, Salsbury C, Teixeira MM, Hellewell PG, Coats AJS. Tumor necrosis factor and
 25 steroid metabolism in chronic heart failure: possible relation to muscle wasting. *J Am Coll Cardiol* 1997; 30:997-1001; Coats AJS, Clark AL, Piepoli M, Volterrani M, Poole-Wilson PA. Symptoms and quality of life

in heart failure; the muscle hypothesis. *Br Heart J* 1994; 72:S36-S39.].

One of the most studied aspects is activation of the sympathetic nervous system (SNS). Activation of the SNS can be expressed in several different ways. Apart from measuring circulating catecholamines (particularly

5 noradrenaline, adrenaline, and dopamine), it is possible to assess sympathetic nervous excitation directly by measuring nerve impulses [Van de Borne P, Montano N, Zimmerman B, Pagani M, Somers VK. Relationship between repeated measures of hemodynamics, muscle sympathetic nerve activity, and their spectral oscillations. *Circulation*

10 1997; 96:4326-4332.], or indirectly by analysing heart rate and blood pressure variability [Ponikowski P, Anker SD, Chua TP, Szelemiej R, Piepoli M, Adamopoulos S, Webb-Peploe K, Harrington D, Banasiak W, Wrabec K, Coats AJS. Depressed heart rate variability as an independent predictor of death in patients with chronic heart failure. *Am J Cardiol*

15 1997;79:1645-1650]. The technique of assessing catecholamine levels has also been developed further by assessing the catecholamine spill-over using radio-labelled tracers [Coats Adamopoulos S, Radelli A, McCance A, Meyer TE, Bernardi L, Solda PL, Davey P, Ormerod O, Forfar C, Conway J, Sleight P. Controlled trial of physical training in chronic heart

20 failure: exercise performance, hemodynamics, ventilation, and autonomic function. *Circulation* 1992;85:2119-2131.]. Nevertheless, measurement of catecholamine levels at rest are the most widely used technique. In this respect it is important to note, that noradrenaline and adrenaline are not only released from the adrenal medulla (as hormones), but that they are

25 also neurotransmitters that are released into the synaptic cleft of sympathetic post-ganglionic nerves (therefore also termed adrenergic). Only a small proportion of the synaptically released catecholamines spills

over into the circulation. Therefore measured plasma concentrations of noradrenaline and adrenaline may in some circumstances grossly underestimate the local catecholamine concentration in the adrenergic synapses.

5

Catecholamines: from myocardial infarction to heart failure

Sympathetic activation is well recognised to be important contributing to the development of myocardial ischaemia [Heusch G. α -Adrenergic mechanisms in myocardial ischaemia. *Circulation* 1990;81:1-13.].

10 Cardiac β -receptors mediate increases of heart rate and inotropy, that under normal conditions lead to coronary dilation to match the oxygen demand. The direct effect of catecholamines on the coronary blood vessel is vasoconstriction mediated via α -adrenoreceptors [Berne RM. Effect of

15 epinephrine and norepinephrine on coronary circulation. *Circ Res* 1958;6:644-655.]. During exercise catecholaminergic vasoconstriction is mainly mediated through circulating catecholamines and not through local hormone release [Chilian WM, Harrison DG, Haws CW, Snyder WD, Marcus ML. Adrenergic coronary tone during submaximal exercise in the

20 dog is produced by circulating catecholamines. Evidence for adrenergic denervation supersensitivity in the myocardium but not in coronary vessels. *Circ Res* 1986;58:68-82.]. After the development of coronary plaques and stenosis, the vasodilatory flow reserve is reduced and the metabolic vasodilation is more and more and more reduced as a result of

25 α -adrenergic coronary vasoconstriction [Heusch G, Deussen A. The effects of cardiac sympathetic nerve stimulation on the perfusion of stenotic coronary arteries in the dog. *Circ Res* 1983;53:8-15.].

Dramatic increases of catecholamine levels have been detected early after the onset of infarction in a variety of studies. Alone between 1969 and 1980, 15 studies with about 25000 patients and 5000 control subjects (see
 5 overview in [Goldstein DS. Plasma noradrenaline as an indicator of sympathetic neural activity in clinical cardiology. *Am J Cardiol* 1981;**48**:1147-1154.]) have investigated plasma noradrenaline levels after myocardial infarction. Catecholamine levels peak within minutes to few hours after the onset of symptoms, and they continue to be raised for
 10 several days. The degree of the enzymatic changes during the myocardial infarction [Vetter NJ, Adams W, Strange RC, Oliver MF. Initial metabolic and hormonal response to acute myocardial infarction. *Lancet* 1974;**1**:284-289.], ie severity of the heart attack, the early onset of ventricular arrhythmias [McDonald L, Baker C, Bray C, McDonald A,
 15 Restieaux N. Plasma-catecholamines after myocardial infarction. *Lancet* 1969;**2**:1021-1023.], the development of cardiogenic shock [Benedict CR, Grahame-Smith DG. Plasma adrenaline concentrations and dopamine-beta-hydroxylase activity in myocardial infarction with and without cardiogenic shock. *Br Heart J* 1979;**42**:214-220.], and of congestive heart failure
 20 [McDonald *et al* (1969) *Lancet* **2**:1021-1023; Siggers DCM, Salter C, Fluck DC. Serial plasma adrenaline and noradrenaline levels in myocardial infarction using a new double isotope technique. *Br Heart J* 1971;**33**:878-883.] are all related to plasma catecholamine levels. In patients with myocardial infarction and clinical heart failure noradrenaline
 25 remains elevated for about 1 month [Sigurdsson A, Held P, Swedberg K. Short- and long-term neurohormonal activation following acute myocardial infarction. *Am Heart J* 1993;**126**:1068-1076.]. Sedative treatment with

morphines [Mueller HS, Gory DJ, Rao PS, Mudd G, Ayres SM. Cardiac catecholamine response during evolving myocardial infarct in man. *Circulation* 1980 (Suppl III);62:III-81. (abstract)], and β -blockers [Mueller HS, Ayres SM. Propranolol decreases sympathetic nervous activity reflected by plasma catecholamines during evolution of myocardial infarction in man. *J Clin Invest* 1980;65:338-346.] have long been known to be able to reduce catecholamine levels during acute myocardial infarction. Ischaemic heart disease is the most common cause of developing CHF.

10

When heart failure has fully developed it is then difficult to establish what exactly induces neurohormonal activation, as both the underlying disease process itself and the medication contribute to the complex hormonal alterations. Measurements in untreated patients have revealed that the sympathetic system is activated (raised catecholamine levels), but that in contrast the renin-angiotensin system is usually not activated [Francis GS, Benedict C, Johnstone DE, Kirlin PC, Nicklas J, Liang CS, Kubo SH, Rudin-Toretsky E, Yusuf S. Comparison of neuroendocrine activation in patients with left ventricular dysfunction with and without congestive heart failure. A substudy of the Studies of Left Ventricular Dysfunction (SOLVD). *Circulation* 1990;82:1724-1729; Remes J, Tikkanen I, Fyhrquist F, Pyorala K. Neuroendocrine activity in untreated heart failure. *Br Heart J* 1991;65:249-255.]. The initial sensor to activate these alterations remains unclear, but it is known that in the absence of a neurohormonal body response the blood pressure would fall, ie tissue blood perfusion would be insufficient [Harris P. Congestive cardiac failure: central role of the arterial blood pressure. *Br Heart J* 1987;

25

58:190-203.]. Therefore the initial triggers of neurohormonal activation in heart failure could be baroreceptors in the heart and aorta. When heart failure progresses other mechanisms may gain more importance. The baroreflex responses are blunted in stable chronic heart failure, whereas the peripheral and central chemoreflex sensitivity [Pomikowski P, Chua TP, Piepoli M, Ondusova D, Webb-Peploe K, Harrington D, Anker SD, Volterrani M, Colombo R, Mazzuero G, Giordano A, Coats AJ. Augmented peripheral chemosensitivity as a potential input to baroreflex impairment and autonomic imbalance in chronic heart failure. *Circulation* 1997 Oct 21;96(8):2586-2594; Chua TP, Clark AL, Amadi AA, Coats AJ. Relation between chemosensitivity and the ventilatory response to exercise in chronic heart failure. *J Am Coll Cardiol* 1996;27:650-657.] as well as the metabo-ergoreceptor reflex (afferents sensitive to skeletal muscle work load) [Piepoli M, Clark AL, Volterrani M, Adamopoulos S, Sleight P, Coats AJ. Contribution of muscle afferents to the hemodynamic, autonomic, and ventilatory responses to exercise in patients with chronic heart failure: effects of physical training. *Circulation* 1996 Mar 1; 93(5):940-952.] deliver a strong sympathetic nervous input that may finally also lead to chronically raised catecholamine levels in severe chronic heart failure.

Catecholamines and weight loss in CHF patients

Only recently, we have documented [Anker SD, Chua TP, Swan JW, Ponikowski P, Harrington D, Kox WJ, Poole-Wilson PA, Coats AJS. Hormonal changes and catabolic/anabolic imbalance in chronic heart failure: The importance for cardiac cachexia. *Circulation* 1997;96:526-

534.] that, when considering the conventional disease severity markers peak oxygen consumption, left ventricular ejection fraction (LVEF), and NYHA class, none of these markers very strongly related to resting noradrenaline and adrenaline levels. However, the presence of cardiac cachexia, ie significant non-intentional non-oedematous weight loss (>7.5% of the previous normal weight), related closely to the presence of raised catecholamine levels. Non-cachectic patients with CHF did on average not have elevated catecholamine levels.

10 Catecholamines can alter the metabolic status of the body, ie they can contribute to increased metabolic rates that may finally lead to a catabolic status and weight loss. This has never been considered to be a basic mechanism for body wasting in human disease in general.

15 *Catecholamines and weight loss in wasting disorders*

We have studied a variety of other cachectic conditions - for instance due to AIDS, liver cirrhosis, chronic obstructive pulmonary disease, chronic renal failure, chronic infections (like pneumonia) and cancer - and we have found activation of the SNS as evidenced by elevated plasma noradrenaline levels (mean plasma levels were clearly above the upper limit of the normal range, see Figures 1 and 2). This is not dependent on any specific aetiology for the cachectic disorder, in fact we find elevated noradrenaline plasma levels (ie SNS activity) also in cases of idiopathic cachexia, ie cachexia of unknown origin. Nevertheless, we find the activation of the SNS to be specific for cachectic disorders, as it is not seen in patients with a similar degree of weight loss consequent upon

malnutrition.

Method to measure noradrenaline:

5 Blood samples were collected after supine rest of at least 10 minutes. An antecubital polyethylene catheter was inserted and 10 ml of venous blood were drawn. After immediate centrifugation aliquots (EDTA plasma sample) were stored at -70°C until analysis. Noradrenaline was measured by reverse-phase high pressure liquid chromatography (HPLC) with
10 electrochemical detection. The detectable limit was: 0.2 nmol/l. The within batch coefficient of variance of repeated measures is less than 5%, the between batch coefficient of variance for repeated measures is 9%. The upper limit of normal for subjects (mean + 2 standard deviations of control group: 3.31 nmol/l).

15

Example 2: Analysis of aldosterone serum levels in cachectic subjects with chronic wasting disorders

Aldosterone serum levels have been analysed in a number of subjects with
20 these disorders compared to healthy controls, patients with weight loss due to malnutrition (ie no active wasting disease), and CHF patients without cachexia (see Table below and Figure 3). Patients with active wasting disease have on average 2.5 to 13-fold increased aldosterone levels compared to healthy control subjects (their mean: 43.2 ng/ml, upper limit
25 or normal: 81 ng/ml). Patients with weight loss due to malnutrition have normal aldosterone levels. This supports our view that high aldosterone levels are pathophysiologically linked to the presence of chronic active

body wasting due, ie cachexia, and that treatment with aldosterone antagonists may be beneficial.

Table: Mean serum aldosterone levels in ng/ml.

5

Means Table for Aldosterone ng/ml

Effect: Cachexia diag.-Aldost

	Count	Mean	Std. Dev.	Std. Err.
AIDS	4	105.25	124.14	62.07
Cancer	7	163.57	59.59	22.52
cCHF	17	168.18	102.83	24.94
Control	16	43.19	18.87	4.72
Infection	11	184.91	398.17	120.05
Liver/cirrhosis + Cachexia	6	578.17	297.16	121.32
Malnutrition	6	55.50	39.56	16.15
ncCHF	16	98.12	59.07	14.77
Renal failure cachexia	2	456.00	2.83	2.00

10 cCHF is cachectic CHF and ncCHF is non-cachectic CHF.

We conclude that abnormalities of aldosterone-linked metabolic pathways occur in cachectic disorders independently of the specific aetiology for the cachectic disorder. Nevertheless, we find the alteration of the aldosterone pathway to be specific for cachectic disorders, as it is not seen in patients with a similar degree of weight loss consequent upon malnutrition.

15

Method to measure aldosterone:

Blood samples were collected after supine rest of at least 10 minutes. An antecubital polyethylene catheter was inserted and 10 ml of venous blood were drawn. After immediate centrifugation aliquots were stored at – 70°C until analysis. Aldosterone was measured using a commercially available competitive radioimmunoassay (DPC, Los Angeles, USA, sensitivity 10 ng/ml). This test is a coated tube assay using radioiodinated tracer. Bound and free phases are separated by decantation. The radioactivity in the bound fractions is measured and a typical standard curve can be generated. The test has a cross-reactivity with spironolactone and aldosterone metabolites of <1% and a within test coefficient of variance is <7% and the between test variability is <10%.

Example 3: Endothelin-1 (ET-1), TNF and xanthine oxidase activity

We have previously suggested that the metabo-ergoreceptor reflex (afferents sensitive to skeletal muscle work load) [Piepoli M, Clark AL, Volterrani M, Adamopoulos S, Sleight P, Coats AJ (1996) “Contribution of muscle afferents to the hemodynamic, autonomic, and ventilatory responses to exercise in patients with chronic heart failure: effects of physical training” *Circulation* 93(5), 940-952] can deliver a strong sympathetic nervous input that may finally lead to chronically raised catecholamine levels, ie that *via* this mechanism activation of the sympathetic nervous system (SNS) may occur. We have presented data in Example 2 that catecholamine levels are specifically raised in many cachectic syndromes.

The sensitivity of the metabo-ergoreceptor reflex response is determined by the general metabolic status of the musculature, the main determinant of the latter is the blood flow to the musculature, because *via* the blood flow the musculature receives its supply of oxygen and nutrients.

It is a characteristic of cachectic patients with CHF to have a poor peripheral blood flow [Anker SD, Swan JW, Volterrani M, Chua TP, Clark AL, Poole-Wilson PA, Coats AJS (1997) "The influence of muscle mass, strength, fatiguability and blood flow on exercise capacity in cachectic and non-cachectic patients with chronic heart failure" *Europ Heart J* **18**, 259-269]. We have previously published that high uric acid levels [Anker SD, Leyva F, Poole-Wilson, Kox WJ, Stevenson JC, AJS Coates (1997) "Relationship between serum uric acid and lower limb blood flow in patients with chronic heart failure" *Heart* **78**, 39-43] and TNF α [Anker SD, Volterrani M, Egerer KR, Felton CV, Kox WJ, Poole-Wilson PA, Coats AJS (1998) "Tumor necrosis factor - α as a predictor of peak leg blood flow in patients with chronic heart failure" *Q J Med* **91**, 199-203] are very strong correlates of impaired peripheral blood flow in CHF patients. We now propose that treating high TNF α -levels (with TNF α -antibodies or other drugs to reduce biologically active TNF levels – like soluble TNF receptor constructs) and/or high uric acid levels (with xanthine oxidase inhibitors) may improve skeletal muscle blood flow, thereby muscle metabolic status and then metabo-ergoreceptor reflex response, and finally SNS status and the wasting disorder improve.

Another possibility to treat cachexia arises when endothelin-1 (ET-1), the

strongest endogenous vasoconstrictive hormone, is considered. Its levels have never been determined in cachectic patients. We present data that ET-1 is significantly highest in cachectic CHF patients ($p < 0.05$ vs controls and non-cachectic CHF patients, respectively), although NYHA class and left ventricular ejection fraction (LVEF) were not different between patient groups. Also age was not different between groups. CHF patients without cachexia do not show abnormal ET-1 levels.

Table: Clinical characteristics and endothelin-1 (ET-1) levels in CHF patients with and without cachexia and healthy control subjects.

parameter	controls n=7	non-cachectic CHF n=11	cachectic CHF n=12
age (years)	70 ± 2	66 ± 3	67 ± 3
NYHA class		2.3 ± 0.1	2.7 ± 0.3
LVEF (%)		34 ± 5	30 ± 6
ET-1 (pmol/l)	1.97 ± 0.38	2.22 ± 0.28	2.98 ± 0.20

Although not being bound by any theory a proposed mechanism of action is:

a) inhibition of ET-1 bioactivity by blocking ET-1 receptors, then induction of vasodilation, improvement of muscle blood flow and thereby of metabolic status, then less stimulation of SNS activation, positive effects on cachexia;

b) blocking of $\text{TNF}\alpha$ bioactivity, less damage to vasculature and less muscle cell damage directly (inhibition of directly detrimental effects of TNF) and indirectly (inhibition of oxygen free radical generation due to

TNF action), thereby improvement of muscle blood flow and muscle cell function and thereby of muscle metabolic status, then less stimulation of SNS activation, positive effects on cachexia and wasting in general;

- 5 c) blocking of xanthine oxidase activity, less production of xanthine oxidase derived oxygen free radicals, therefore less damage to vasculature and muscle cells, thereby improvement of muscle blood flow and muscle cell function and thereby of muscle metabolic status, then less stimulation of SNS activation, positive effects on cachexia and wasting in general.

10

The improved muscle blood flow, muscle cell function and muscle metabolic status believed to be brought about by blocking of TNF α activity is considered to be beneficial in enhancing exercise performance in a healthy patient.

15

Example 4: Cardiorespiratory reflexes in chronic heart failure (CHF) patients with cardiac cachexia

Cardiac cachexia in patients with chronic heart failure (CHF) predicts very
20 poor prognosis and is linked to neurohormonal activation and an altered balance between catabolism and anabolism (in favour of catabolism).

Impaired sympatho-vagal balance in CHF is important part of
neuroendocrine overactivity, is linked to a poor outcome and the
25 underlying mechanisms remain unexplained, but overactive muscle ergoreflex system is one possible stimulus.

Having in mind the neurohormonal changes and high mortality in CHF patients with cardiac cachexia, we hypothesised that in these patients a particularly abnormal pattern of cardiorespiratory reflexes is present. The aim of the study described here was to assess whether impaired reflex control within the cardiorespiratory system (as evidenced by baroreflex inhibition, peripheral chemoreflex overactivity, and abnormal heart rate variability [HRV] patterns) is associated with the presence of cardiac cachexia rather than with conventional markers of CHF severity.

10 *Patients*

39 stable CHF patients studied:

all men, age 60 y, NYHA class: II-IV, peak VO_2 :17 ml/kg/min, LVEF:24%

15

Patients divided into 2 groups:

- 13 patients with cardiac cachexia vs 26 non-cachectic CHF patients
- cachectic and noncachectic patients were matched according to age and CHF disease severity

20

Cardiac cachexia:

non-intentional, non-edematous, documented weight loss $>7.5\%$ of the previous normal weight over a period of >6 months, and a BMI ($=\text{weight}/\text{height}^2$) $<24 \text{ kg/m}^2$ (to exclude obese dieters)

25

Control Subjects

For the comparison of the results of HRV and baroreflex sensitivity 11 healthy controls (all men, mean age: 60 ± 7 y) were studied.

5

For the comparison of the results of peripheral chemosensitivity and hormonal measurements data for healthy data for healthy control subjects from the following studies were used:

- 10 - peripheral CHEMA (chemoreflex sensitivity): Chua TP *et al* (1995) *Eur J Clin Invest* **25**, 887
- hormonal measurements: Anker SD *et al* (1997) *Circulation* **96**, 526

15 *Methods (1)*

1. Evaluation of the cardiorespiratory reflex control

Assessment of the sympatho-vagal control of heart rate

20

power spectral analysis of HRV derived from 20 minutes recorded the following spectral bands were identified: very low frequency (0.003-0.04Hz, VLF), low frequency (0.05-0.14Hz, LF), and high frequency (0.15-0.40Hz, HF)

25

Peripheral chemosensitivity evaluation

transient hypoxic method (the ventilatory response to hypoxia using
transient inhalations of pure nitrogen)

5

Methods (2)

Baroreflex sensitivity

10 phenylephrine method

2. Hormonal measurements

Fasting venous blood samples

15

collected in the morning (9 and 10 am)
after patients' supine rest of at least 20 min
levels of epinephrine and norepinephrine measured using HPLC
(sensitivity 0.1 ng/ml for both)

Conclusions

1. Patients with chronic heart failure who developed cardiac cachexia demonstrate particularly abnormal reflex control within the cardiovascular
5 and respiratory systems.

2. The nature of the link between this phenomenon and the hormonal changes and the poor prognosis of cachectic CHF patients raises the potential for novel therapeutic strategies targeting the wasting process in
10 cachectic CHF patients by altering the reflex status of patients that could lead to less activation of the sympathetic nervous system and better symptomatic status.

Example 5: Treatment with atenolol

15

A hypertensive patient presented weighing 85.6 kg. He was treated with Losartan 50 mgs OD, Bendrofluazide 2-5 mgs OD, Doxazosin 1 mg OD and Atenolol, a β -blocker, 50 mgs OD. In 11 months his weight increased to 94.3 kg.

CLAIMS

1. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective
5 amount of an agent which reduces sympathetic nervous system activity and/or improves cardiovascular reflex status.
2. A method according to Claim 1 wherein the agent which reduces sympathetic nervous system activity is any one or more of the following:
10 a compound which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α receptor antagonist; a ganglion blocking agent; a drug that has an effect on cardiovascular reflexes and thereby
15 reduce SNS activity such as an opiate; scopolamine; endothelin receptor antagonist; a xanthine oxidase inhibitor; and erythropoietin.
3. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective
20 amount of a compound which inhibits the effect of aldosterone, such as an aldosterone antagonist.
4. A method according to Claim 3 wherein the compound which inhibits the effect of aldosterone is any one of spironolactone, testolactone,
25 RU40555, RU26752, canrenoate, eplerenone, 3-(17 β -hydroxy-3-oxoandrosta-1,4,6,11-tetraen-17 α -yl) propionic acid γ lactone, 3-(9- α -fluoro-17 β -hydroxy-3-oxo-androsta-4-en-17 α -yl) propionic acid γ lactone,

dihydro-spirorenone, spirorenone, 15,16-methylene derivatives of spironolactone, mespirenone and SC9420.

5 5. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a chymase inhibitor.

6. A method according to Claim 5 wherein the chymase inhibitor is any one of alendronate, aprotinin and tissue inhibitors of matrix
10 metalloproteinases.

7. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a cathepsin inhibitor.

15

8. A method according to Claim 7 wherein the cathepsin B inhibitor is any one of an epoxysuccinyl peptide such as CA-074 or E64-c, stefin A and cystatin C.

20 9. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a β receptor blocker.

10. A method according to Claim 9 wherein the β receptor blocker is
25 any one of acebutolol, alprenolol, atenolol, betaxolol, bisoprolol, carteolol, celiprolol, esmolol, labetolol, lavobunolol, metipranolol, metoprolol, nadolol, oxprenolol, penbutolol, pindolol, propanolol, sotalol, timolol, nebivolol, carvedilol and bucindolol.

11. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of an imidazoline receptor antagonist.

5

12. A method according to Claim 11 wherein the imidazoline receptor antagonist is any one of moxonidine, rilmenidine, pentamidine and α -methyl dopa.

10 13. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a centrally acting α receptor agonist.

14. A method according to Claim 13 wherein the centrally acting α receptor agonist is clonidine.

15

15. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a peripherally acting α receptor antagonist.

20

16. A method according to Claim 15 wherein the peripherally acting α receptor antagonist is any one of doxazosin, prazosin, terazosin and ipsapirone.

25 17. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a ganglion blocking agent.

18. A method according to Claim 17 wherein the ganglion blocking agent is any one of azamethonium, dicolinium, hexamethonium, mecamlamine, pentamethonium, pentolinium, trimetaphan, benzohexonium, hexafluorenium, cypenam, trimethaphan canfosulfonate,
5 tetraethylammonium bromide and synapleg.

19. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of a drug that has an effect on cardiovascular reflexes and thereby
10 reduces SNS activity.

20. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of an opiate.
15

21. A method according to Claim 20 wherein the opiate is any one of dihydrocodeine, morphine, diamorphine and buprenorphine.

22. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of scopolamine.
20

23. A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of an endothelin receptor antagonist.
25

24. A method according to Claim 23 wherein the ET-1 receptor antagonist is any one of butenolide, BQ123, BQ-788, A-216546, ABT-

627, IRL3461, LU135252, S-0139, T-0201, PD 142,893, PD 164333, RO 61-1790, PD 156,707, SB 209670, IRL 1038 and WS-7338 B.

25. A method of treating weight loss due to underlying disease in a
5 patient the method comprising administering to the patient an effective
amount of a xanthine oxidase inhibitor.

26. A method according to Claim 25 wherein the xanthine oxidase
inhibitor is any one of allopurinol, 7,8-dihydroneopterin, 5,6,7,8-
10 tetrahydrobiopterin, leukopterin, xanthopterin, neopterin, biopterin, 4-
amino-6-hydroxypyrazolo[3,4-d]pyrimidine (AHPP) and oxypurinol.

27. A method of treating weight loss due to underlying disease in a
patient the method comprising administering to the patient an effective
15 amount of erythropoietin.

28. A method of treating weight loss due to underlying disease in a
patient the method comprising electrically stimulating the patient's
muscles.

20

29. A method according to any one of the preceding claims wherein the
underlying disease is any one of AIDS, liver cirrhosis, chronic obstructive
pulmonary disease with or without emphysema, chronic renal failure,
chronic infections, cancer, heart disease including hypertension and
25 chronic heart failure.

30. A method according to any one of Claims 1 to 29 wherein the
patient has idiopathic cachexia.

31. A method according to any one of Claims 1 to 29 wherein the underlying disease is chronic heart failure and the patient has cardiac cachexia.

5

32. Use of a compound as defined in any one of Claims 1 to 36 in the manufacture of a medicament for treating weight loss due to underlying disease.

10 33. Use according to Claim 32 wherein the underlying disease is as defined in Claim 28.

34. Use of a compound as defined in any one of Claims 1 to 36 in the manufacture of a medicament for treating idiopathic cachexia.

15

35. A method of treating or preventing weight loss due to the ageing process in a patient the method comprising administering to the patient an effective amount of an agent which reduces sympathetic nervous system activity.

20

36. A method of treating or preventing weight loss due to the ageing process in a patient the method comprising administering to the patient an effective amount of any one or more of a compound which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α receptor antagonist; a ganglion blocking agent; a drug that has an effect on cardiovascular reflexes and thereby reduce SNS activity such as

25

an opiate, a digitalis alkaloid, scopolamine; an endothelin receptor antagonist; a xanthine oxidase inhibitor; and erythropoietin.

37. A method of treating or preventing weight loss due to the ageing
5 process in a patient the method comprising electrically stimulating the patient's muscles.

38. A method of enhancing exercise performance in a healthy patient
the method comprising administering to the individual an effective amount
10 of an agent which reduces sympathetic nervous system activity.

39. A method of enhancing exercise performance in a healthy
individual the method comprising administering the individual an effective
amount of any one or more of a compound which inhibits the effect of
15 aldosterone such as an aldosterone antagonist; a chymase inhibitor; a
cathepsin inhibitor; a β receptor blocker; an imidazoline receptor
antagonist; a centrally acting α receptor antagonist; a peripherally acting α
receptor antagonist; a ganglion blocking agent; a drug that has an effect on
cardiovascular reflexes and thereby reduce SNS activity such as an opiate;
20 a digitalis alkaloid; scopolamine; an anabolic growth factor like growth
hormone and insulin-like growth factor-I (IGF-I); an endothelin receptor
antagonist; a $\text{TNF}\alpha$ antagonist; a xanthine oxidase inhibitor; and
erythropoietin.

25 40. A method of enhancing exercise performance in a healthy patient
the method comprising electrically stimulating the patient's muscles.

41. A method of preventing weight loss consequent to a cardiovascular disorder in a patient at risk of heart disease the method comprising administering to the patient an effective amount of any one or more of a compound with an inhibiting effect on aldosterone; a β -receptor blocker; 5 an imidazoline receptor antagonist; a centrally acting α receptor agonist; a peripherally acting α receptor antagonist; and a ganglion blocking agent.

42. Use of a compound as defined in Claim 35 or 36 in the manufacture of a medicament for treating or preventing weight loss due to ageing in a 10 patient.

43. Use of a compound as defined in Claim 38 or 39 in the manufacture of an agent for enhancing exercise performance in a healthy individual.

ABSTRACT**METHODS OF TREATMENT**

- 5 A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of an agent which reduces sympathetic nervous system activity.

10 A method of treating weight loss due to underlying disease in a patient the method comprising administering to the patient an effective amount of any one or more of the following: a compound which inhibits the effect of aldosterone such as an aldosterone antagonist; a chymase inhibitor; a cathepsin B inhibitor; a β receptor blocker; an imidazoline receptor antagonist; a centrally acting α receptor antagonist; a peripherally acting α
15 receptor antagonist; a ganglion blocking agent; a drug that has an effect on cardiovascular reflexes and thereby reduce SNS activity such as an opiate; scopolamine; an endothelin receptor antagonist; and a xanthine oxidase inhibitor.

- 20 The methods are particularly useful in treating cardiac cachexia.
